INDEPENDENT CONTRACTOR AGREEMENT

This Independent Contractor Agreement ("Agreement") effective as of the date last signed below, is made by and between SerpApi LLC, a Texas limited liability company ("Company") and Zilvinas Kucinskas, an individual residing in Lithuania ("Contractor"). Company and Contractor may be referred to individually as a "Party" and collectively as "Parties".

In consideration of the mutual promises and covenants contained herein, the Parties agree as follows:

1. Services to be Performed.

Contractor agrees to perform the services of a "Senior Software Engineer" for Company ("Services") in accordance with this Agreement. Except for items agreed to between Company and Contractor, Contractor certifies that it owns, or intends to purchase at its own expense, all equipment and technology and tools required to perform the Services. Contractor further acknowledges that the Services are unique and require Contractor's personal performance. Accordingly, Contractor shall not subcontract, or allow any person or entity to perform, any or all of the Services without Company's prior written approval, which may be withheld in Company's sole discretion.

2. Payment.

In consideration for the performance of the Services, Company agrees to pay Contractor \$40.00 per hour worked, provided that the hourly rate will increase to \$42.50 per hour 90 days after Contractor begins performing the Services. Contractor will invoice Company bi-weekly and each invoice will include a reasonably summary of the work performed during that two week period. In addition, the Company, at Company's sole and absolute discretion, may pay Contractor a bonus pursuant to the Discretionary Cash Bonus Policy, the terms of which are set out in Exhibit A to this Agreement. The Company shall pay the Contractor no more than 7 business days after invoice reception.

3. Relationship of the Parties.

Neither this Agreement nor the relations between the Parties shall constitute or be deemed to be that of a partnership, joint venture, employer and employee or principal and agent, it being expressly understood and agreed that the Parties are, and at all times shall be and remain, independent contractors. In their capacities as independent contractors, Company and Contractor agree as follows:

- i. Neither Party is the other's legal representative or agent for any purpose, and has no authority to, and shall not make any warranties or representations or create any obligations for the other Party.
- ii. Company will not (i) withhold FICA (Social Security and Medicare taxes) from payments to Contractor or (ii) make FICA payments on Contractor's behalf, or (iii) make state or

- federal unemployment compensation contributions on Contractor's behalf, or (iv) withhold state or federal income tax from Contractor's payments.
- iii. Contractor shall pay all taxes incurred while performing Services under this Agreement, including all applicable income and payroll taxes and, if Contractor is not a corporation, self-employment (Social Security) taxes. Upon demand, Contractor shall provide Company with proof that all tax related payments have been made.
 - iv. Contractor agrees that neither Contractor nor Contractor's employees or contract personnel are eligible to participate in any employee pension, health, vacation pay, sick pay, or other fringe benefit plan of Company.
 - v. Company shall not obtain workers' compensation insurance on behalf of Contractor or Contractor's employees. Contractor will be solely responsible for obtaining workers compensation insurance to the extent required by law and will provide Company with a certificate of workers compensation coverage upon request.
 - vi. Contractor is customarily engaged in an independently established trade, occupation, or business of a similar nature as the Services.
 - vii. Contractor is free to perform services for other persons or entities, subject to Contractor's compliance with the confidentiality obligations of Section 4.

4. Confidential Information.

a. Confidential Information may include but is not limited to business decisions, plans, procedures, strategies and policies, existing and planned technology, customer records, contractual terms and arrangements (including prospective purchases and sales), pricing strategies, financial and business forecasts and plans and other information affecting the value or sales of products, goods, or services of Company (collectively, the "Confidential Information"). Confidential Information expressly includes all Trade Secrets, as that term is defined in the Defend Trade Secrets Act of 2016, 18 U.S.C. §1836, et seq. Furthermore, Confidential Information includes all information of an Company customer which is disclosed to Contractor in performing the Services. Confidential Information does not include any of the foregoing items which has become publicly known and made generally available through no wrongful act of Contractor or of others that Contractor knows to be under an obligation not to disclose the information.

b. Contractor agrees that Contractor, and all Contractor employees and personnel performing the Services, will: (i) hold all Confidential Information in strictest confidence; (ii) not use any Confidential Information except to benefit Company or its customer; and (iii) not disclose any Confidential Information to any person or entity without the written consent of Company, provided that written consent will not be required if Contractor is required to disclose the Confidential Information by a duly issued subpoena or other governmental order and Contractor provides Company with notice of the required disclosure promptly upon Contractor's receipt of the order.

5. Equitable Remedies.

Contractor agrees that it would be impossible or inadequate to measure and calculate Company's damages from any breach of the covenants set forth in Section 4. Accordingly,

Contractor agrees that if Contractor or a Contractor employee or agent breaches Section 4, Company will have available, in addition to any other right or remedy available by this Agreement or applicable law, the right to obtain an injunction from a court of competent jurisdiction restraining such breach or threatened breach and to specific performance of any provision of this Agreement. No bond or other security shall be required in obtaining such equitable relief, and Contractor consents to the issuance of such injunction and to the ordering of specific performance.

6. Representations and Warranties by Contractor.

Contractor warrants, represents, covenants, and agrees that Contractor: (i) has the requisite skill and training to perform the Services contemplated by this Agreement; (ii) is under no contract, non-compete, confidentiality, non-disclosure or similar restriction with a third party that would interfere with the provision of the Services to Company, or that would render the provision of the Services a violation of law or subject Company to the possibility of damages; and (iii) will perform the Services in compliance with the terms of this Agreement and applicable law.

7. Terminating the Agreement.

Either Party may terminate this Agreement with or without cause at any time by giving not less than fourteen (14) days' written notice of the intent to terminate.

8. Work Product.

The product of all work performed by Contractor under this Agreement ("Work Product"), including without limitation all notes, reports, documentation, drawings, computer programs, inventions, creations, works, models, work-in-progress and deliverables will be the sole property of Company, and Contractor assigns to Company all right, title and interest therein, including but not limited to all audiovisual, literary, moral rights and other copyrights, patent rights, trade secret rights and other proprietary rights therein. Contractor retains no right to use the Work Product and agrees not to challenge the validity of Company's ownership in the Work Product.

9. Venue/Choice of law.

Any claim arising under this Agreement shall be brought in the courts of the State of Texas and be governed by the application of Texas law without regard to its conflict of law principles. Both Parties waive their right to trial by jury to the maximum extent permitted by law.

10. Survival.

In the event of the expiration or termination of this Agreement, Sections 8, 9, and 10 shall survive and continue in full effect. In the event of the expiration or termination of this Agreement, Sections 4 and 5 shall survive and continue in full effect for a period of three (3) years.

11. Force majeure.

Notwithstanding anything to the contrary contained herein, neither Party shall be liable for any delays or failures in performance resulting from acts beyond its reasonable control including, without limitation, acts of God, terrorist acts, shortage of supply, breakdowns or malfunctions, interruptions or malfunction of computer facilities, or loss of data due to power failures or mechanical difficulties with information storage or retrieval systems, labor difficulties, war, or civil unrest.

12. Notices.

Notices or other communication under this Agreement will be in writing and will be effective when delivered personally or by overnight courier, or mailed, postage prepaid, by certified or registered mail to each Party at the address set forth above (or to such other address as either Party may from time to time provide the other). Notices may also be delivered by email and will be deemed delivered on the first business day following transmission.

13. Assignment.

Neither Party may assign, delegate or otherwise transfer any of its rights or obligation under this Agreement without the other Party's prior written approval; provided that Company may assign this Agreement, in whole or in part, or any of its rights hereunder to an affiliate or successor without the written consent of or notification to Contractor.

14. Preparation of Agreement.

There will be no presumption against either Party on the ground that such Party was responsible for preparing all or any part of this agreement.

15. Entire agreement/Modification/Waiver.

This Agreement represents the entire agreement between the Parties concerning the subject matter hereof. This Agreement may not be modified except in a writing signed by both Parties, and it will be binding on and will inure to the benefit of the Parties hereto, and their heirs, administrators, successors, and permitted assigns. Any waiver must be in writing and signed by the Party alleged to have waived such provision, and any single waiver will not operate to waive subsequent or other defaults. The unenforceability of any provision of this Agreement will not affect the remaining provisions or any portion(s) thereof.

IN WITNESS WHEREOF, the Parties hereto, intending to be legally bound, have each caused to be affixed hereto its hand and seal as of the date first written above.

EXHIBIT A

Zilvinas Kucinskas Cash Bonus Plan

(a) 0.30% of SerpApi, LLC profit every quarter starting the next quarter after one full quarter working full time at SerpApi, LLC distributed according and following the conditions of the SerpApi DISCRETIONARY CASH BONUS POLICY.

(b) 0.30% of SerpApi, LLC sale in case of a SerpApi, LLC sale vested linearly on 4 years with a 1 year cliff working full time at SerpApi, LLC distributed according and following the conditions of the SerpApi DISCRETIONARY CASH BONUS POLICY. SerpApi, LLC will still pay a cash bonus if a SerpApi, LLC sale occurs within 6 months of Contractor termination at the amount vested at the date of the termination.

A handwritten signature in blue ink, appearing to read "Thompson", is located in the bottom right corner of the page.

DISCRETIONARY CASH BONUS POLICY

SERPAPI, LLC

From time to time, SerpApi, LLC ("Company") may pay a cash bonus ("Bonus") to employees and contractors. I understand that it is the intent of the Company that Bonuses reward individuals who contribute to the Company's success through their hard work, but that the payment of any Bonus to me is entirely at the discretion of the Company as described in this Policy. Accordingly, I acknowledge the following:

1. DETERMINATION OF BONUS

Within a reasonable time after the close of each fiscal quarter, the Company will determine if a Bonus will be paid to employees and contractors. Whether a bonus will be paid, the amount of any Bonus, and the individuals who will receive a Bonus will be determined by the Company in its sole and absolute discretion. I understand that no history or pattern of paying Bonuses to me in prior periods will be construed as: i) a guarantee or obligation of the Company to pay any Bonus to me in the future even if the Company experiences similar or better financial and operating results; or ii) a course of dealing regarding the methodology for determining a bonus or the allocation of any Bonus among employees and contractors.

2. PAYMENT OF BONUS

Each Bonus, if any, shall be paid in cash in a single lump sum as soon as administratively practicable, but in no event later than two and one-half months after the end of a fiscal quarter. The Company shall withhold all required taxes from a Bonus, including any federal, state, local or other taxes. Any Bonus shall be paid solely from the general assets of the Company, and no amount of cash or assets shall be funded, set aside or otherwise segregated for the payment of Bonuses.

All Bonuses are discretionary and therefore are not included in my regular rate of pay subject to overtime under Labor Code Section 7(e) (3)(a).

3. NO EFFECT ON EMPLOYMENT OR INDEPENDENT CONTRACTOR RELATIONSHIP

If I am an employee, nothing in the Policy or my acknowledgement herein shall be construed as an employment contract and my employment with the Company is and will remain on an at-will basis only. The Company expressly reserves the right, which may be exercised at any time, to terminate or modify my employment with or without cause, and to treat me without regard to the effect that such treatment might have upon the payment of a Bonus to me.

If I am a Contractor, nothing in this Policy or my acknowledgement shall be construed to be a modification or amendment to any term or condition of my contract, including but not limited to the terms and conditions relating to compensation, term and termination of any such contract.

4. SECTION 409A NOT APPLICABLE

It is intended that payments of Bonuses under the Policy qualify as short-term deferrals exempt from the requirements of Section 409A of the Internal Revenue Code. In the event that any Bonus does not qualify for treatment as an exempt short-term deferral, it is intended that such amount will be paid in a manner that satisfies the requirements of Section 409A of the Code. The Policy shall be interpreted and construed accordingly.

5. AMENDMENT AND TERMINATION

The Company may amend or terminate the Policy, or any part thereof, at any time and for any reason without notice to me. Notwithstanding the foregoing, no amendment or termination of the Policy shall adversely affect my rights to a Bonus declared by the Company prior to such amendment or termination.

6. LEGAL CONSTRUCTION

In the event any provision of the Policy shall be held illegal or invalid for any reason, the illegality or invalidity shall not affect the remaining parts of the Policy, and the Policy shall be construed and enforced as if the illegal or invalid provision had not been included. The Policy and all awards shall be construed in accordance with and governed by the laws of the State of Texas, without regard to their conflict-of-law provisions.

By signing below, I hereby acknowledge that I have completely read and fully understand the Discretionary Cash Bonus Policy adopted by SerpApi, LLC ("Company") on _____, 2020.

ACKNOWLEDGED AND AGREED TO:

[Best Scraper API \(best web scraping API\) of 2024](#)

TechRadar Pro

November 1, 2024 Friday 11:47 AM EST

Copyright 2024 Future Publishing Ltd All Rights Reserved

Length: 2336 words

Body

In the digital age, data is king, and the goal of web scraping API is to send a request to a website of your choice and, in return, collect data. While scraping APIs are not that complex to set up, basic programming skills are still required. But don't worry; watching a quick tutorial or two on the topic will get you up to speed quickly.

Equipped with this essential technique for data extraction, you and your business can extract data that can assist with your market research, lead generation, or competitor analysis, among other things. This is why we delve into the best web scraping APIs available in 2024, highlighting their features, benefits, and why they stand out.

Our Top Picks for 2024

Best overall

[1. Oxylabs Scraper API](#)

Best web scraping API overall

Rock-solid reliability and scalability
Great at dodging complex anti-bot systems
Detailed reporting and analytics
A tad pricey

When it comes to large-scale scraping, Oxylabs is the heavyweight champion. Armed with all the goodies like top-tier CAPTCHA-busting tools, a massive proxy collection, and JavaScript rendering for dynamic websites, its Scraper API is built for serious data extraction.

Its proxy pool includes over 102 million residential and data center proxies for maximized scraping success, alongside geo-targeting capabilities for scraping data from specific regions, and more. As such, it is best suited for large-scale price monitoring, competitor research, and SEO analytics.

Now, here is the kicker - all that power comes with a hefty price tag. Its Enterprise package starts at \$499 per month, which gives you 330,000 results with 50 requests per second. If you don't need that much firepower, you can go for a more wallet-friendly Regular plan, which starts at \$49/month. There is also a 7-day free trial.

Read our full [Oxylabs review](#).

- [^ Back to the top](#)

Best for data collection

[2. Bright Data](#)

Best Scraper API (best web scraping API) of 2024

Best for comprehensive data collection

Highly customizable Massive proxy pool Expensive

Looking for a web scraping tool that shines in more ways than one? Look no further than Bright Data. With its enormous proxy network and top-notch scraping skills, this star player has what it takes to pull real-time data from almost anywhere on the web.

With over 72 million proxies, Bright Data excels at slicing through CAPTCHAs and navigating JavaScript-rendered pages like it is a Sunday stroll. Having all the tools you will likely need, it is a great choice for data aggregation, financial services research, market analysis, and gathering information about the competition.

In contrast, the high pricing threshold at \$499/month might give some pause. That said, there is also a handy pay-as-you-go option at \$1 per 1,000 records, and each pricing package includes a free trial that doesn't require your financial details.

Read our full [Bright Data review](#).

- [^ Back to the top](#)

Best for ease of use

[3. ScrapingAnt](#)

Best for ease of use

Inexpensive and easy Fast response times Limited scalability for enterprises

ScrapingAnt was made with speed and ease of use in mind. It is a quick API that won't make a dent in your wallet and focuses on getting structured data from JavaScript-dominant websites, all without requiring you to fiddle with proxies or CAPTCHAs.

Not only is this scraping solution equipped with a CAPTCHA solver and JavaScript handler, but it also prides itself with some extras. For instance, users can customize HTTP headers for more efficient stealth scraping.

The platform can be used to scrape blogs and news websites but also for tasks such as lead generation and directory scraping. Pricing is competitive, starting at \$19 per month, which makes it accessible to a wider audience.

Read our full [ScrapingAnt review](#).

- [^ Back to the top](#)

Best for speed and simplicity

4. ScrapingBee

Best for speed and simplicity

Affordable Simple integration Lacks more advanced features

For developers dealing with JavaScript-rich websites, ScrapingBee is a no-fuss, effective solution. It removes the hassle of managing proxies or handling CAPTCHAs by yourself, focusing on quick deployment and rendering web pages like a real browser.

ScrapingBee is great for social media monitoring and scraping dynamic websites like ecommerce product listings, as it combines headless browser support and proxy rotation. It also features custom HTTP headers and request settings for stealth scraping.

Best Scraper API (best web scraping API) of 2024

Add affordable pricing into the mix, which starts at \$49 per month for 150,000 API credits and 5 concurrent requests, and ScrapingBee is a no-brainer. Plus, it has a free trial with 1,000 free API calls, and no credit card required, so you can take it for a spin before committing.

- [^ Back to the top](#)

Best for advanced users

5. ScraperAPI

Best for advanced users

Simplified integration Affordable plans Not great for highly complex websites

ScraperAPI keeps things easy and efficient with automated proxy rotation, CAPTCHA solving, and JavaScript rendering. This all makes it an optimal pick for developers and businesses that just want to plug in and get data without having to code up a storm.

Its Swiss Army knife approach to web scraping covers all the basics: over 5 million residential and data center proxies, CAPTCHA code busting, and handling JavaScript for scraping in a breeze - all without the need for complex setup or integration troubles.

Thanks to these key features, ScraperAPI is great for scraping product information off ecommerce sites and monitoring competitors' pricing and product offerings. Its pricing plans are as simple as its integration, starting at \$49 per month for 100,000 API calls. There is also a 7-day free trial with 5,000 API calls, no credit card is needed.

- [^ Back to the top](#)

Best for high level customization

6. Apify

Best for high level customization

Highly customizable Scalable cloud infrastructure Requires technical know-how for advanced setups

An all-in-one web scraping powerhouse, Apify offers a robust scraper API and a tool for creating tailored workflows. It distinguishes itself with flexibility that enables developers to automate scraping processes and store large amounts of harvested data on the cloud.

Depending on whether you select a free tier or one of its paid plans starting at \$49/month, you will get pre-built actors for common scraping tasks. These include scraping the likes of LinkedIn or Amazon, modifiable workflows for specific business needs, cloud storage options, and more.

Such a high level of customization and a long list of features make Apify the dream tool for scraping data from websites in the real estate industry, analyzing social media chatter, or performing automated and continuous data pulling.

- [^ Back to the top](#)

Best for large-scale scraping

7. Zyte

Best for large-scale scraping

Best Scraper API (best web scraping API) of 2024

Excellent for large-scale scraping Managed services for complex needs Pricey for smaller businesses

If you are looking to extract data from websites while dodging their defenses, then Zyte has you covered with its Smart Proxy Manager, a powerful scraper API, and other treats. It is a complete package equipped with built-in proxy management, configurable settings, and more.

Among the platform's primary advantages are its 14 million IPs ready to roll, smart proxy rotation, automatic CAPTCHA bypass and browser fingerprint spoofing, as well as advanced scraping reports and analytics for even the toughest websites.

Its best use cases range from web data aggregation for media outlets to price comparison tools. Depending on the website tier and spending limit, the pricing opens at \$100 per month or \$0.20 on a pay-as-you-go basis, but you can also give it a run for free if you are just testing the waters.

- [^ Back to the top](#)

Best for open-source-conscious users

8. Octoparse

Best for open-source-conscious users

No coding required Scalable cloud infrastructure Limited customization for developers

If coding gives you a headache but you still need to scrape, Octoparse is here to save the day. This no-code solution allows users to create scrapers without any programming knowledge. Not only this, but Octoparse's cloud-based scraping platform does everything from rotating proxies to solving CAPTCHA.

This tool offers a visual scraper builder that simplifies the scraping process without users ever touching a line of code. One of its standout features is its cloud-based scraping for scheduling and automating tasks. Of course, JavaScript rendering is thrown in for good measure.

Octoparse's versatility makes it suitable for a wide range of use cases, including social media monitoring and ecommerce data scraping. It offers a free plan to dip your toes in, while paid options, providing more advanced features, will cost you at least \$99 per month.

- [^ Back to the top](#)

Best for search engines

9. SerpApi

Best for search engines

Ideal for scraping search engines Real-time search results Not quite suited for general web scraping

In case scraping search engines is your bread and butter, **SerpApi** is what you need. It is laser-focused on pulling accurate and recent SERP (Search Engine Results Pages) data for SEO research. Plus, it offers location-based searches, manages proxies, busts CAPTCHA, and delivers real-time results.

As such, **SerpApi** is most commonly employed for keyword rankings, search volume, and trends. It can also be used in competitor analysis and price tracking by scraping search engines for ecommerce listings.

In terms of pricing packages, its base plan costs \$75 per month for 5,000 searches. That said, there is also a free tier that supports 100 searches per month if you are just getting started.

- [^ Back to the top](#)

Best for ecommerce products

10. WebScrapingAPI

Best for ecommerce products

Fast and efficient Great for scraping JavaScript-bulky content Not as feature-rich as higher-end solutions

If speed is what you need, WebScrapingAPI has your back. This fast and reliable tool is designed to make the process of scraping large amounts of data super simple.

It manages automatic proxy switching, CAPTCHA solving, and seamless JavaScript rendering without slowing you down. Finally, it includes customizable headers and geo-targeting features.

Suited for scraping ecommerce products, news articles, or reviews, WebScrapingAPI has a free trial and packages starting at \$19/month for 7,000 API calls. However, its Basic subscription at \$49/month is more attractive, as it includes 20,000 API calls.

FAQs

What is a scraper API?

A scraper API is described as a set of protocols and tools that allows you to automatically interact with websites, pulling all the data you need without having to sift through it manually. [Web scraping](#) as a process, in its classical sense, usually requires creating ways to overcome the nuances of these interactions, like bypassing detection and CAPTCHAs.

Scraper APIs do the heavy lifting. They usually include helpful features like automatic proxy rotation (so you don't get blocked), CAPTCHA handling (so you don't waste your time), and JavaScript rendering (so you don't miss out on dynamic content).

All of this means you can sit back, relax, and let the scraper API handle the tough stuff. As it does, you can work with and analyze the collected information for your purposes.

Why do you need a scraper API?

Ever tried scraping websites manually? It can be a major pain. Getting blocked, fighting CAPTCHAs, and dealing with JavaScript content is a nightmare. Scraper APIs take away that hassle by automating the whole process.

If you need a great deal of data from across the Internet, they let you scale up without having to worry about getting blocked or dealing with complicated websites. Also, they are super reliable, allowing you to take a break from constantly tinkering with scripts after every website update.

As a result, you can devote your attention to other aspects of your project.

Things to consider when choosing a scraper API

When you are on the hunt for a scraper API, you don't just want to grab the first one you encounter. You want to keep some things in mind to make sure you are going with the right fit, including:

Ease of Integration: Go for an API with solid documentation, SDKs, and some sample code. It will simplify the process of connecting it to your existing system.

Best Scraper API (best web scraping API) of 2024

Data Accuracy: You will want an API that reliably extracts the information you need, especially from tricky sites with tons of dynamic content or sneaky anti-scraping defenses.

CAPTCHA and Anti-Bot Handling: If you're scraping websites that frequently deploy these methods, make sure your API is a pro at getting around them.

Proxy Management: A proper scraper API should automatically switch up your proxies and, ideally, allow you to collect data from different regions for that geo-targeted goodness.

Performance: Speed and reliability matter big time. Seek an API that responds fast and keeps running without hiccups, especially if you are collecting mountains of data.

Pricing: Let's be real - some scraper APIs can cost an arm and a leg. Look for one that fits your budget, more so if you plan to level up your operations and embark on some serious scraping.

Legal Compliance: It is not all fun and games; you need to play by the rules. Your scraper API of choice should comply with data privacy laws such as the General Data Protection Regulation (GDPR), especially when scraping sensitive information.

How to pick the best scraper API?

Deciding on the right scraper API is not a one-size-fits-all situation. It depends on all sorts of things, like how big your project is, how complex the websites you have to scrape are, and how much cash you are willing (or can afford) to spend.

For big-time, enterprise-level scraping, Oxylabs and Bright Data are the go-to choices with their behemoth proxy pools and advanced features. For smaller projects or if you are just starting out, check out ScraperAPI, ScrapingBee, and ScrapingAnt as budget-friendly and simpler choices.

All things considered, using a scraper API is about automating data collection to gain valuable insights and make better decisions. Just make sure you follow the law and scrape responsibly to avoid any trouble down the line.

Google SERP APIs Ranked by Speed, Cost, and Pain Points (2026 Update)

 hasdata.com/blog/best-serp-apis

[Back to all posts](#)

Roman Milyushkevich

Last update: 5 Jan 2026

Most SERP APIs promise simplicity: “Send a query, get results.” But what you get in return - slow responses, broken HTML, awkward JSON - can vary wildly.

We put 10 of them through the same controlled test: same query, same time window, repeated runs. We measured latency across percentiles, pricing impact at scale, and developer experience (like nested fields, retries, and output sanity).

No one API did it all. But some made scraping feel almost boring - and that’s a good thing.

P95 shouldn't feel like a timeout

Methodology

- Test setup: identical query (“Coffee”), US geolocation, desktop UA
- Timing: same UTC time window, 1000 requests per API
- Metrics captured:
 - P50, P75, P95 latency
 - Response consistency (failures, malformed JSON)
 - Cost per 1,000 requests
 - Output format quality (e.g., clean JSON structure, duplication, parsing overhead)
 - Retry behavior and rate limiting
 - Ease of use: authentication, docs, sandboxing, SDKs

TL;DR Summary Table

The best Google SERP APIs in 2026 include HasData for real-time data with 100% accuracy, DataForSEO for affordability and scalability, and Bright Data for extensive proxy support and customization. These APIs provide structured search results, keyword insights, and SERP tracking across regions and devices.

API	CPM	P50	P95	Notes
HasData	\$1.22	2.3s	3.0s	Clean JSON, retry-safe, fast, LLM-ready output
SerpAPI	\$15	2.5s	4.6s	Feature-rich, expensive at scale, polished SDKs
Apify	\$3.5	13,7s	30.1s	Browser-based scraping, slower
ZenSerp	\$10	3.9s	11.3s	Organic results sometimes missing or misparsed in JSON
BrightData	\$1.8	2.6s	4.9s	Responses include base64-encoded images (not LLM-friendly); “Perspectives” block mislabeled as “Related Questions”
DataForSeo	\$10	4.7s	15.8s	Flat, verbose JSON with mixed content types in a single items[] array (e.g., organic, images); requires manual filtering
ScrapingBee	\$8.2	20.9s	41.6s	Basic JSON output; limited or no rich snippet support
SerpWow	\$12	11.1s	24.7s	Basic JSON output; limited or no rich snippet support
Oxylabs	\$2.8	5.5s	15.6s	Base64 images (not LLM-friendly); good coverage of rich snippets; no raw HTML included

API	CPM	P50	P95	Notes
ScraperApi	\$12.25	4.1s	20.1s	Basic JSON output; limited or no rich snippet support

Note: CPM refers to the cost per 1,000 requests.

HasData

HasData's [SERP API](#) uses simple key-based authentication. The documentation is clean and practical, with an interactive API Playground that lets you preview responses and auto-generate code in multiple languages. You can set search parameters like country, device type, pagination, or search type (web, images, maps, news) directly from the UI. It also integrates with Zapier and Make.com, which is useful for lightweight automation without writing code.

In our test, HasData delivered the fastest and most consistent response times. Median latency was 2.3 seconds, with 95th percentile at 3.0 seconds. There were zero failures or retries needed across all runs.

JSON responses are clean and flat. Fields are properly structured, no base64 images, and no nested garbage. It returns screenshots alongside data, which is useful for visual validation or building tools like SERP history viewers. All output is LLM-friendly out of the box.

Retry logic is transparent and reliable. The service handles anti-bot measures like captchas and IP blocks without exposing these issues to the user, which is useful for production scraping pipelines.

The main drawback is cost. The cheapest plan starts at \$75/month, translating to about \$15 per 1,000 requests - significantly higher than competitors. This may not be viable for projects that require large volumes of data or real-time use at scale.

Best suited for teams that need rich SERP data across multiple verticals and don't mind paying for convenience. It's a solid choice if you prioritize structured output, full feature coverage, and SDK support.

Apify

The screenshot shows the Apify website homepage. At the top, there is a navigation bar with the Apify logo and links for Product, Solutions, Developers, Resources, Pricing, Contact sales, Log in, and a prominent "Get started" button. The main heading is "Your full-stack platform for web scraping". Below this, a sub-heading reads: "Apify is the largest ecosystem where developers build, deploy, and publish web scrapers, AI agents, and automation tools. We call them Actors." A search bar is located below the sub-heading, containing the text "Scrap" and a "Search" button. The page displays a grid of six Actor cards, each representing a different scraping tool. Each card includes an icon, the Actor name, a brief description, and statistics such as the number of users and a star rating.

Actor Name	Description	Users	Rating
TikTok Data Extractor	Extract data about videos, users, and channels based on hashtags or scrape full user profiles...	26.4k	4.8
Google Maps Extractor	Extract data from hundreds of places fast. Scrape Google Maps by keyword, category, location...	42.6k	4.3
Instagram Scraper	Scrape and download Instagram posts, profiles, places, hashtags, photos, and comments. Get...	93.9k	4.4
Website Content Crawler	Crawl websites and extract text content to feed AI models, LLM applications, vector databases, or...	49.6k	4.6
Amazon Scraper	Gets you product data from Amazon. Unofficial API. Scrapes and downloads product informatio...	6.3k	4.4
Build your own Actor	Apify gives you all the tools and documentation you need to build reliable scrapers. Fast.	?	5.0

Apify offers a Google SERP API as part of its broader scraping platform. The service relies on browser-based scraping under the hood, which contributes to flexibility but also introduces latency. In our test, it was the slowest by a wide margin, with a median latency of 13.7 seconds and a P95 of 30.1 seconds.

Authentication is straightforward via token, but most usage examples assume you'll use Apify's SDK. Only Node.js and Python are covered officially, and the examples lean heavily on their platform-specific libraries. Using the raw HTTP API without their tooling requires extra effort and lacks proper documentation support.

On the upside, Apify allows users to configure and schedule SERP scraping jobs through their dashboard. This is convenient for recurring batch jobs that don't require real-time processing.

However, for developers who want to directly integrate SERP extraction into their own pipeline, the lack of raw API examples and the reliance on platform-specific runtimes can be a roadblock. It's also not ideal for real-time use due to high response times.

Best suited for batch scraping workflows where runtime isn't critical and where users are comfortable operating inside Apify's ecosystem.

Zenserp

The screenshot shows the Zenserp website interface. At the top, there is a navigation bar with links for FEATURES, PRICING, BLOG, STATUS, CONTACT, REGISTER, and LOG IN. The main content area features the headline "Effortlessly Scrape Accurate Search Results with Our Google SERP API" and a sub-headline "No more incomplete queries, outdated versions, or credential issues. Get started with just a few clicks by signing up for our free plan." Below this are buttons for "FREE PLAN" and "VIEW PRICING". At the bottom left, it lists "SUPPORTED PLATFORMS" including Google, Bing, Yandex, and DuckDuckGo. On the right, a search interface shows the query "Pied Piper" and a "SEARCH" button. Below the search bar, a JSON response is displayed, showing an organic search result for "Pied Piper of Hamelin" from Wikipedia, including fields for position, title, url, destination, and description.

Zenserp provides APIs for multiple search engines, including Google. Setup is simple with API key authentication, and the service includes a Playground to configure requests and preview the output. Code snippets can be generated in several languages, but we noticed occasional syntax issues in the generated examples.

The response format is clean and relatively easy to work with, though it lacks the depth of richer APIs like HasData or SerpAPI. During testing, some organic search results were either missing or not parsed correctly in the JSON, which makes the output unreliable for use cases that depend on complete SERP coverage.

One notable security concern: the API returns your own API key in the response payload. This poses a risk, especially if you're using the API in a shared environment or logging full responses. An accidental leak could allow someone to exhaust your quota.

Performance was reasonable for a mid-tier provider. Median latency was 3.9 seconds, with a 95th percentile at 11.3 seconds. No failures occurred during the test, but the parsing inconsistencies and key exposure are concerning.

Zenserp is a workable option for light or experimental use, especially if you're prioritizing simplicity and don't need deep SERP feature support. It's less suitable for production environments that require strong security practices and complete result fidelity.

Brightdata

BrightData is best known as a proxy network but also provides a Google SERP API. To use it, you must create an account and set up a dedicated “zone” for the Google Search API. Configuration happens in the dashboard, where you can also test requests using their Playground.

While you do get a JSON response through the Playground, the generated code examples are misleading - they show how to fetch raw HTML from Google using BrightData's proxies rather than using the structured SERP API. This creates confusion, especially for users expecting a plug-and-play JSON output.

That said, BrightData does offer a parsing endpoint for structured output, but it's a separate step and not well-documented. Without using that endpoint, you're left with HTML content that requires manual parsing. In our tests, JSON responses included base64-encoded images, which are not ideal for LLMs or analytics workflows. Some SERP features, like the “Perspectives” block, were mislabeled (e.g., returned as “Related Questions”).

Latency was solid - P50 at 2.6 seconds and P95 at 4.9 seconds - and no response failures were recorded. However, the setup process is heavier compared to direct API competitors, and there's more room for human error.

BrightData is a good fit if you're already using their proxy infrastructure and want to extend it with search scraping. Otherwise, the indirection and inconsistencies in output make it less ideal for developers looking for a ready-to-integrate SERP API.

DataForSEO

Powerful API Stack For Data-Driven Marketers

We provide comprehensive SEO and digital marketing data solutions via API

TRY FOR FREE SEE PRICING

All the data your SEO software requires is now in one place

DataForSEO offers a broad suite of APIs aimed at SEO automation, including a Google SERP API. Unlike most competitors, registration isn't self-serve for everyone - only companies can sign up through the site directly. Individuals or freelancers need to manually contact support, explain their use case, and wait for credentials to be issued via email.

Authentication is handled via a combination of login and password, not a simple API key. Once configured, the API is stable and well-documented, but slightly more complex to integrate due to its non-standard auth flow and request format.

The response structure is flat and verbose, with all result types bundled into a single items[] array. You'll need to filter for type: "organic", type: "images", and so on, depending on what you're extracting. This makes processing slower and error-prone, especially at scale.

In testing, the P50 latency was 4.7 seconds, with a P95 of 15.8 seconds. No outright failures, but slower than most direct competitors. No rich snippets were missing, but parsing overhead is high due to the flat structure.

DataForSEO is better suited for batch analytics jobs where you're comfortable filtering raw data and don't need real-time speed. It's a viable option for internal tools or dashboards.

AI

Proxy Solutions WEB Scraper API Video Data

Oxylabs offers a Google SERP API as part of its larger suite of data extraction tools. You can test requests in the API Playground, and integration into your own application is straightforward once credentials are set up.

The API returns structured JSON, and support for rich SERP features like featured snippets and ads is solid. However, raw HTML is not included, and image data is returned as base64, which makes it less suitable for workflows involving LLMs.

In our tests, the P50 latency was 5.5 seconds, with a P95 of 15.6 seconds. Parsing was accurate and stable across runs, with no critical data missing. Response formatting was consistent, but the presence of encoded assets increased payload size and post-processing requirements.

Oxylabs is a decent option for teams already using its residential proxy infrastructure or looking for rich snippet coverage. Just be prepared for slightly higher integration overhead compared to APIs that use token-based auth and return raw or cleaner payloads.

ScrapingBee, SerpWow, ScraperAPI

These three services offer basic Google SERP APIs with straightforward setup - all support standard API key authentication and provide quick-start examples. Their documentation is sufficient for basic use, and integration into simple projects is easy.

However, all three returned underwhelming results in testing. JSON responses are minimal and often lack important SERP features like featured snippets, ads, or extended metadata. The structure is generally shallow, and in some cases, raw HTML or irrelevant markup appears inside the JSON payload. These make them ill-suited for anything beyond very basic scraping.

Performance also varied widely. ScrapingBee was the slowest of the entire group, with a median latency of 20.9 seconds and a P95 of 41.6 seconds. SerpWow and ScraperAPI fared slightly better, with P50s of 11.1 and 4.1 seconds respectively, but both showed high P95 times and occasional instability under load.

None of the services support LLM-friendly output or deeper SERP coverage. Rich snippets were either missing or partially parsed. For real-time applications, analytics workflows, or structured ingestion, they require too much post-processing to be practical.

These APIs might be suitable for simple prototyping or one-off tasks where cost is the main concern and precision isn't critical. But for production-grade use, more robust alternatives exist.

Key Takeaways

Fastest and cleanest output: HasData - best latency, LLM-friendly JSON, minimal post-processing

Most feature-complete: SerpAPI - handles rich SERP elements, but expensive at scale

High integration overhead: BrightData, DataForSEO and Oxylabs - stable, but require extra work for auth or parsing

Final Thoughts

If you need fast, structured SERP data that just works, HasData is the most efficient option.

SerpAPI is solid if you need every SERP feature and have the budget for it.

The rest come down to trade-offs - latency, completeness, setup complexity, or cost.

Pick based on your use case. For real-time apps or LLM ingestion, clean JSON and low latency matter more than screenshot support or raw HTML.

For batch analytics, speed is less critical, so both browser-based and non-browser APIs can work - just be prepared to handle format inconsistencies or higher response sizes depending on the provider.

Rich snippets

All-in-one platform
We support a wide range of rich snippets available on the page. We constantly add new ones once they become available.

Organic Results

One search result page can contains up to 100 results. Using Pagination, up to 400.

Ads
All type of Google ads, including their position on the search result page.

News Results

Inline news as part of the organic results, including thumbnail, description and target url.

Video Results

Inline video results as part of the organic results, including their title and url.

Knowledge Graph

Search results can contain a knowledge block containing search query related information.

Related Questions

Find what you need with advanced filters, bulk actions, and quick views.

Maps Results

Google Maps search results return information for stores, local businesses like restaurants, etc..

Other snippets

We add new rich snippets on a constant basis.

I have been using SearchAPI for over a year and it has greatly improved my business. It is easy to use and the customer support is excellent. I highly recommend it for scraping search engine result pages.
Judith Black
CEO at DataInsights

Powerful Infrastructure

Meet even the most demands
Leverage our powerful infrastructure.

No Proxy Management

We utilize a huge list of proxies. We benchmark and rotate them often.

Multiple locations

Gather localized search results from 195 countries with coordinate-level precision.

99.9% SLA Guarantee

The SLA guarantee comes with a 100% penalty. We offer credits up to 100% of the monthly price of your plan on your next invoice.

Captcha solving

SearchAPI behaves like a real-human. This includes full browser rendering, Javascript execution, and even CAPTCHA solving.

Real-time API

Infrastructure is built for reliability, performance, and scale to allow us return real-time results.

JSON Results

Get structured data. No need to write complex regexes and selectors to extract the data.

Making public data accessible to everyone.

```

EXTENSIVE SEARCH RESULTS

Get JSON results in seconds

Scrape organic results, ads, related searches, inline questions and more. Receive structured results in JSON format.

Rich snippets
All-in-one platform

Supporting a vast array of rich snippets found on web pages, we continually update

✓ Organic Results
Access position, snippet, link, date, sitelinks, rich snippets, nested results, and much more.

✓ Knowledge Graph
Obtain search query-related information within search results' knowledge blocks.

Rich snippets

All-in-one platform

Supporting a vast array of rich snippets found on web pages, we continually update our platform to include new ones as they become available.

- ✓ **Organic Results**
Access position, snippet, link, date, sitelinks, rich snippets, nested results, and much more.
- ✓ **Knowledge Graph**
Obtain search query-related information within search results' knowledge blocks.
- ✓ **Ads**
Scrape all types of Google ads, along with their positions on the search result page.
- ✓ **People Also Ask**
Explore frequently asked questions related to the search query.
- ✓ **News Results**
Extract inline news within organic results, including thumbnail, description, and target URL.
- ✓ **Maps Results**
Retrieve Google Maps search results for local businesses like stores, restaurants, and more.
- ✓ **Related searches**
Discover relevant keywords for your content with related searches.
- ✓ **Other snippets**
We continuously add new rich snippets to our platform.

SearchApi's fast and reliable scraping capabilities coupled with their exceptional customer support have been invaluable to our business. We're able to focus on growth and development instead of maintenance.

Captcha Solving

Advanced CAPTCHA bypass

Mimics real human behavior with full browser rendering, JavaScript execution, and CAPTCHA solving for uninterrupted data scraping.

Integrations

Open-source integrations

Easily integrate with popular open-source tools like Dify, Flowise, LangChain, and Haystack to extend functionality with minimal setup.

Frequently asked questions

If you can't find what you're looking for, you can always [send us an email](#) with your enquiry.

What data does the Google Search API provide?

Our Google Search API provides a wealth of data including organic search results, paid search results, knowledge graph entries, local map listings, featured snippets, and related search queries. It captures real-time search engine results pages as seen by users.

How often is the data from the Google Search API updated?

The data is fetched in real-time, ensuring that you always get the most current Search data whenever you make a request. This allows you to stay updated with the ever-changing search engine landscape.

How do I integrate the Google Search API with my application?

Integration is straightforward. Refer to our [Google Search API](#) documentation for request examples.

Can I use the Google Search API for keyword rank tracking?

Absolutely. The Google Search API is designed to help you monitor keyword rankings and their positions on the search results page. You can track keywords for specific locations, devices, and languages.

Can I use the Google Search API to monitor my competitors' paid ads?

Yes, the Google Search API includes data on paid ads, allowing you to analyze competitors' ad copy, display URLs, and ad positioning.

Žilvinas Kučinskas

CEO at SearchApi
Vilnius, Vilniaus, Lithuania

Summary

Hi! I'm Zilvinas Kucinskas, an independent developer who's specialized working with Ruby on Rails, Sidekiq, Hotwire (Stimulus + Turbo), TailwindCSS, PostgreSQL, Redis, Elasticsearch, Docker, Terraform and AWS.

Here's what I can help you with:

Building SaaS applications, especially API as a service.
Scraping data at scale.
Performance optimizations.
Infrastructure as a code on AWS.
SEO (Search Engine Optimization).
System design.

My GitHub account: <https://github.com/ZilvinasKucinskas>

Experience

SearchApi
CEO
2023 - Present (3 years)
United States

Building a collection of real-time SERP APIs with a focus on developer experience, reliability, low latency, and one of the best ad scraping success rates in the industry.

ExportData
Founder
September 2019 - 2023 (4 years)
London, England, United Kingdom

Created a SaaS platform to export and analyze historical Twitter data.
Acquired by Fedica.

Sedition

Staff Engineer

August 2021 - October 2022 (1 year 3 months)

London, England, United Kingdom

Netflix for Art

SerpApi

Senior Software Engineer

June 2020 - August 2021 (1 year 3 months)

Austin, Texas, United States

Real-time API to access structured search results of Google, Youtube, eBay, and other search engines.

Fractal

Senior Software Engineer

October 2018 - June 2020 (1 year 9 months)

Remote

Working on a single sign-on KYC/AML software solution. It features a fully compliant onboarding process with a focus on usability for an international audience that is easy to integrate.

- Implemented the OAuth 2.0 authorization server, supporting authorization code, resource owner password, and client credentials flow.
- Designed and implemented a 2-factor authentication flow.
- Designed and implemented webhooks (push notifications).
- Designed and implemented a billing system utilizing EventSourcing.
- Made significant contributions to various frontend/backend applications/microservices and terraform deployment process.

Technology Stack:

Ruby, Ruby on Rails, Javascript (Webpack, React, Redux), PostgreSQL, Terraform, Amazon Web Services, Docker, Sendgrid, Pivotal Tracker, Slack.

AVWallet

Software Engineering Contractor

April 2018 - September 2018 (6 months)

- Gathered a team of 5 people to design and implement cryptocurrency wallet MVP from scratch.
- Led user-flow, wireframes, and high fidelity prototype design stages.

- Managed project cost, estimates, priorities, and communication with a client.
- Set up high availability infrastructure using Amazon Web Services.
- Implemented API for the whole product - JWT authentication, Facebook / Google authorization server-side flow, 2 factor authentication, support for Bitcoin, and Ethereum cryptocurrencies.
- Conducted 30+ technical interviews.

Technology Stack:

Ruby, Ruby on Rails, Javascript (Webpack, React, React Native), PostgreSQL, Amazon Web Services (VPC, Elastic BeanStalk, Route53, S3, Cloudfront, SQS), Docker, Twilio, TravisCI, Sendgrid, API Blueprint, ClubHouse, Slack.

CGTrader

2 years 10 months

Technical Lead

October 2016 - April 2018 (1 year 7 months)

Vilnius, Lithuania

I was one of the earliest CGTrader permanent hires. We grew up to 8 developers and have received investments worth 2.3M. I know what it takes to build a company, a team, and a stack.

- Conducted technical meetings and support teams from big corporations such as Autodesk.
- Worked closely with sales, marketing, and link-building teams to convert requirements into delivered solutions.
- Created lead generation and qualification techniques for our sales team which have been hugely successful.
- Integrated React framework and Webpack module bundler.
- Executed CDN integration and migration to a new email service provider.
- Ensured high-quality code standards and practices.

Technology stack:

Ruby, Ruby on Rails, JavaScript (Webpack, ES6, React), MySQL, PostgreSQL, Redis, Elasticsearch, Amazon RedShift, Amazon Web Services, Heroku, CoffeeScript, HTML, SASS, Yarn, Git, Nginx, Unicorn, Puma, Capistrano, Sidekiq, Ansible, Jira, NewRelic, Codeship, Honeybadger, Pingdom, Hound CI, Chartio.

Full Stack Ruby on Rails Developer

July 2015 - October 2016 (1 year 4 months)

Vilnius, Lithuania

- Dividing feature epics to smaller subtasks, driving feature architecture decisions.
- Scaled application horizontally on AWS (teamwork).
- Hunted memory leaks in Sidekiq workers. Rewrote background jobs to be idempotent and as small as possible.
- Performance tuning. Fixed MySQL indexes, rewrote 5-10 most time-consuming queries. Changes significantly reduced CPU usage and server response time (by ~200 ms).
- Extended and improved public CGTrader API.
- Implemented Traceparts integration. Released public Traceparts gem.
- Implemented social features to boost Social traffic 300%.
- Implemented various SEO enhancements that increased organic traffic by 30-100%.
- Implemented advanced eCommerce tracking via Google Tag Manager.
- Integrated Honeybadger, registered, and solved a lot of bugs.
- Mentored 3 junior programmers.

Technology stack:

Ruby, Ruby on Rails, MySQL, Redis, ElasticSearch, CoffeeScript, Javascript (jQuery, Backbone.js), HTML, SASS, Git, Nginx, Unicorn, Capistrano, Sidekiq, Vagrant, Ansible, Jira, NewRelic, CircleCI, Honeybadger, Pingdom.

GetaFollow

Co-Founder and CTO

February 2016 - August 2017 (1 year 7 months)

Vilnius, Lithuania

GetaFollow helps you analyze your Instagram followers. Written in Ruby and Ruby on Rails, using the Instagram API, it can drill down into the data to help you understand where your followers are coming from, improve engagement, and optimize the time you spend on marketing.

GetaFollow was the winner of HackerGames Vilnius in the Software category for 2016/7. It was also #1 on the BetaList of trending startups.

- Developed and launched product MVP.
- Built infrastructure from scratch on DigitalOcean servers.

- Implemented responsive web design using Bootstrap, custom responsive emails using Sendgrid.
- Implemented various growth hacks together with a refer-a-friend program.
- Mounted WordPress blog on the same domain URL because of SEO.

Technology stack:

Ruby, Ruby on Rails, JavaScript (jQuery), Bootstrap, Redis, Sidekiq, Git, Capistrano, PostgreSQL, Nginx, Passenger, Trello, WordPress, SendGrid, Travis.CI.

Vibe

Co-Founder and Ruby on Rails Developer

December 2013 - December 2014 (1 year 1 month)

Amsterdam Area, Netherlands

- Created RESTful API for mobile and web integration.
- Crawled music venue websites using Foursquare API and events using Facebook Graph API.
- Integrated Instagram API to get photos from venues.
- Integrated SoundCloud API to fetch music by specific artists.
- Implemented various crawlers to get publicly available data about artists and venues.
- Startup failed due to a lack of investment and technical challenges, especially mapping artists to venues.

Technology stack:

Ruby, Ruby on Rails, Python, Javascript, PostgreSQL, Redis, Sidekiq, Heroku, Trello

Tieto

1 year 2 months

Remote Java Developer

December 2012 - November 2013 (1 year)

Vilnius, Lithuania

- Developed SIP-based (Session Initiation Protocol)solution for one of the biggest telecommunication companies in Europe (TeliaSonera).
- Developed asynchronous messaging services.
- Introduced TDD, written unit and functional tests, performed load testing.

Technology stack:

Java, JUnit, Mockito, MyBatis, Wireshark, WebLogic, HTTP, SIP, SIPP, Python, SVN, Git, JIRA, Bamboo, and more.

Software Engineering Intern
October 2012 - November 2012 (2 months)
Vilnius, Lithuania

Led by the best employees at Tieto, I have spent a month in a cross-functional team. I have been taught Java, Agile methodology, UX, and leadership skills. Successful participation has landed me a full-time job offer at Tieto Corporation.

Technology stack:

Java, Spring Core, Maven, Wicket, Bootstrap, JUnit, Jetty, GIT, Apache CXF, Apache Shiro.

UAB "Programming Services Center"
Software Engineering Contractor
2010 - 2012 (2 years)
Vilnius, Lithuania

- Supporting legacy code. Services were written in various languages, you could even find Pascal in there.
- Created interactive voice response service wrapper, which saved time writing IVR-based applications.

Technology stack:

Java, Gembase, Oracle DB, C++, VB6, SoapUI, SVN, OpenVMS.

Account API

Account API allows you to check the number of searches you made in this month, your plan's monthly limit, your plan's monthly searches left, your account's hourly throughput limit, and if you have an account with no monthly plan then you can also check the remaining credits. Account API is free of charge, and using it will not be counted toward your monthly quota.

You can query <https://serpapi.com/account.json> using a **GET** request with these parameters:

API Parameters

api_key

Required

Parameter is your SerpApi private key. You should be able to retrieve it inside the 'Your Account' tab.

API Examples

Account API example

</> GET

```
1 | https://serpapi.com/account?api_key=SECRET_API_KEY
```

{ } JSON Example

```
{
  "account_id": "5ac54d6adefb2f1dba1663f5",
  "api_key": "SECRET_API_KEY",
  "account_email": "demo@serpapi.com",
  "plan_id": "bigdata",
  "plan_name": "Big Data Plan",
  "plan_monthly_price": 250.0,

  "total_searches_left": 5958,
  "this_month_usage": 24042,
  "last_hour_searches": 42,
  "account_rate_limit_per_hour": 6000
}
```

EXHIBIT 11

Account API

GET /api/v1/me

The Account API provides access to your account usage statistics, allowing you to **retrieve real-time data** on your current monthly usage, remaining credits, and hourly limits.

API Parameters

Search Parameters

`api_key` Required

The `api_key` authenticates your requests. Use it as a query parameter (`https://www.searchapi.io/api/v1/me?api_key=YOUR_API_KEY`) or in the Authorization header (`Bearer YOUR_API_KEY`).

Zero Data Retention

`zero_retention` Enterprise Only Optional

Set this parameter to `true` to disable all logging and persistent storage. No request parameters, HTML, or JSON responses are stored or logged. Suitable for high-compliance use cases. Debugging and support may be limited while enabled.

API Example

Account Usage

This example shows current usage details, helping you stay within your monthly limits and track remaining credits.

Response structure:

`account` General account usage data:

- `current_month_usage` Total searches performed this month.
- `monthly_allowance` Maximum allowable searches per month.
- `remaining_credits` Search credits remaining for the month.

`api_usage` Hourly limits and recent search activity:

- `searches_this_hour` Searches made in the current hour.

- `hourly_rate_limit` Maximum searches allowed per hour.

`subscription` Subscription period information (if an active subscription exists):

- `period_start` Start date of the current subscription period.
- `period_end` End date of the current subscription period.

GET

7   gl: "us",  
8   google_domain: "google.com",  
9   api_key: "secret_api_key"  
10 )  
11  
12 results = client.search
```

Advanced Features

Leverage our infrastructure (IPs across the globe, full browser cluster, and CAPTCHA solving technology), and exploit our structured SERP data in the way you want.

Real Time and Real Results

Each API request runs immediately – no waiting for results.

In addition, each API request runs in a full browser, and we'll even solve all CAPTCHAs, completely mimicking what a human would do. This guarantees that you get what users truly see.

Accurate Locations

Get Google results from anywhere in the world with our "location" parameter.

SerpApi uses Google's geolocated, encrypted params and routes your request through the proxy server nearest to your desired location to ensure accuracy. Get locations at our [locations endpoint](#).

JSON Results

Regular organic results are available as well as Maps, Local, Stories, Shopping, Direct Answer, and Knowledge Graph.

Lots of structured data is available for each result, including links, addresses, tweets, prices, thumbnails, ratings, reviews, rich snippets, and more.

U.S. Legal Shield

The crawling and parsing of public data is protected by the First Amendment of the United States Constitution. We value freedom of speech tremendously. We assume scraping and parsing liabilities for both domestic and foreign companies unless your usage is otherwise illegal. (Including but are not limited to: acts of cyber criminality, terrorism, pedopornography, denial of service attacks, and war crimes.)

  | q=Coffee&location=Austin,+Texas,+United+States&hl=en&gl=us&google_domain=google.com
```

Or by using one of our libraries in your preferred language:

```
</> Code to integrate python JavaScript Go PHP Java Rust .NET Google Sheets  
1 | require "serpapi"  
2 |  
3 | client = SerpApi::Client.new(  
4 |   q: "Coffee",  
5 |   location: "Austin, Texas, United States",  
6 |   hl: "en",  
7 |   gl: "us",  
8 |   google_domain: "google.com",  
9 |   api_key: "secret_api_key"  
10 | )  
11 |  
12 | results = client.search
```

Advanced Features

Leverage our infrastructure (IPs across the globe, full browser cluster, and CAPTCHA solving technology), and exploit our structured SERP data in the way you want.

Real Time and Real Results

Each API request runs immediately – no waiting for results.

In addition, each API request runs in a full browser, and we'll even solve all CAPTCHAs, completely mimicking what a human would do. This guarantees that you get what users truly see.

Accurate Locations

Get Google results from anywhere in the world with our "location" parameter.

SerpApi uses Google's geolocated, encrypted params and routes your request through the proxy server nearest to your desired location to ensure accuracy. Get locations at our [locations endpoint](#).

JSON Results

Regular organic results are available as well as Maps, Local, Stories, Shopping, Direct Answer, and Knowledge Graph.

Lots of structured data is available for each result, including links, addresses, tweets, prices, thumbnails, ratings, reviews, rich snippets, and more.

U.S. Legal Shield

The crawling and parsing of public data is protected by the First Amendment of the United States Constitution. We value freedom of speech tremendously. We assume scraping and parsing liabilities for both domestic and foreign companies unless your usage is otherwise illegal. (Including but are not limited to: acts of cyber criminality, terrorism, pedopornography, denial of service attacks, and war crimes.)

    "q": "chatgpt"
}
```

```
response = requests.get(url, params=params)
print(response.text)
```

RICH SNIPPETS

All-in-one platform

Supporting a vast array of rich snippets found on web pages, we continually update our platform to include new ones as they become available.

- ✓ **Organic Results**

Access position, snippet, link, date, sitelinks, rich snippets, nested results, and much more.
- ✓ **Knowledge Graph**

Obtain search query-related information within search results' knowledge blocks.
- ✓ **Ads**

Scrape all types of Google ads, along with their positions on the search result page.
- ✓ **People Also Ask**

Explore frequently asked questions related to the search query.
- ✓ **News Results**

Extract inline news within organic results, including thumbnail, description, and target URL.
- ✓ **Maps Results**

Retrieve Google Maps search results for local businesses like stores, restaurants, and more.
- ✓ **Related searches**

Discover relevant keywords for your content with related searches.
- ✓ **AI Overview**

Retrieve AI-powered answers to your questions directly from search results.

LEGAL COVERAGE

Legal Protection Guarantee

We accept legal responsibility for how SearchApi collects and parses publicly available search results, backed by up to \$2M in coverage. This protection applies to customers worldwide, operates under U.S. law, and does not cover your use of the data or unlawful activities.

TRUSTED BY INDUSTRY LEADERS

ROBUST INFRASTRUCTURE

Handle even the most demanding needs

Performance

Sub-2 second average response time

Optimized for low latency, delivering rapid results for AI applications, SEO analysis, and research.

100% Success Rate

Guaranteed query completion

Guaranteed success with built-in auto-retry mechanism and adaptive error handling to ensure complete data collection.

Proxy Management

Scalable proxy rotation

Our built-in proxy rotator and auto-retry mechanisms ensure scalability, handling millions of searches daily across a global network of 100M+ proxies.

Captcha Solving

Advanced CAPTCHA bypass

Mimics real human behavior with full browser rendering, JavaScript execution, and CAPTCHA solving for uninterrupted data scraping.

Integrations

Open-source integrations

Easily integrate with popular open-source tools like Dify, Flowise, LangChain, and Haystack to extend functionality with minimal setup.

Frequently asked questions

If you can't find what you're looking for, you can always [send us an email](#) with your enquiry.

What data does the Google Search API provide?

Our Google Search API provides a wealth of data including organic search results, paid search results, knowledge graph entries, local map listings, featured snippets, and related search queries. It captures real-time search engine results pages as seen by users.

Can I use the Google Search API for keyword rank tracking?

Absolutely. The Google Search API is designed to help you monitor keyword rankings and their positions on the search results page. You can track keywords for specific locations, devices, and languages.

How often is the data from the Google Search API updated?

The data is fetched in real-time, ensuring that you always get the most current Search data whenever you make a request. This allows you to stay updated with the ever-changing search engine landscape.

Can I use the Google Search API to monitor my competitors' paid ads?

Yes, the Google Search API includes data on paid ads, allowing you to analyze competitors' ad copy, display URLs, and ad positioning.

How do I integrate the Google Search API with my application?

Integration is straightforward. Refer to our [Google Search API](#) documentation for request examples.

Google Search Engine Results API

API uptime 99.505%

`/search` API endpoint allows you to scrape the results from Google search engine via our SerpApi service. Head to the [playground](#) for a live and interactive demo. You can query <https://serpapi.com/search> using a `GET` request.

API Parameters

Search Query

<code>q</code>	Required	Parameter defines the query you want to search. You can use anything that you would use in a regular Google search. e.g. <code>inurl:</code> , <code>site:</code> , <code>intitle:</code> . We also support advanced search query parameters such as <code>as_dt</code> and <code>as_eq</code> . See the full list of supported advanced search query parameters .
----------------	----------	--

Geographic Location

<code>location</code>	Optional	Parameter defines from where you want the search to originate. If several locations match the location requested, we'll pick the most popular one. Head to the /locations.json API if you need more precise control. The <code>location</code> and <code>uule</code> parameters can't be used together. It is recommended to specify <code>location</code> at the city level in order to simulate a real user's search. If <code>location</code> is omitted, the search may take on the location of the proxy.
<code>uule</code>	Optional	Parameter is the Google encoded location you want to use for the search. <code>uule</code> and <code>location</code> parameters can't be used together.

Advanced Google Parameters

<code>ludocid</code>	Optional	Parameter defines the Google CID (customer identifier) of a place. This parameter can be found in Google Search API and Google Local API local results under the name of <code>place_id</code> , as well as in Google Maps API local results under the name of <code>data_cid</code> . You can also acquire it using Google's CID converter .
<code>tsig</code>	Optional	Parameter that you might have to use to force the knowledge graph map view to show up. You can find the <code>tsig</code> ID by using our Local Pack API or Google Local API . <code>tsig</code> ID is also available via a redirect Google uses within Google My Business .
<code>kgmid</code>	Optional	Parameter defines the id (<code>KG MID</code>) of the Google Knowledge Graph listing you want to scrape. Also known as Google Knowledge Graph ID. Searches with <code>kgmid</code> parameter will return results for the originally encrypted search parameters. For some searches, <code>kgmid</code> may override all other parameters except <code>start</code> , and <code>num</code> parameters.
<code>si</code>	Optional	Parameter defines the cached search parameters of the Google Search you want to scrape. Searches with <code>si</code> parameter will return results for the originally encrypted search parameters. For some searches, <code>si</code> may override all other parameters except <code>start</code> , and <code>num</code> parameters. <code>si</code> can be used to scrape Google Knowledge Graph Tabs.
<code>ibp</code>	Optional	Parameter is responsible for rendering layouts and expansions for some elements (e.g., <code>gwp;0,7</code> to expand searches with <code>ludocid</code> for expanded knowledge graph).
<code>uds</code>	Optional	Parameter enables to filter search. It's a string provided by Google as a filter. <code>uds</code> values are provided under the section: <code>filters</code> with <code>uds</code> , <code>q</code> and <code>serpapi_link</code> values provided for each filter.

values are provided under the section: `filters` with `country` and `serpapi_link` values provided for each filter.

Localization

<code>google_domain</code>	Optional	Parameter defines the Google domain to use. It defaults to <code>google.com</code> . Head to the Google domains page for a full list of supported Google domains.
<code>gl</code>	Optional	Parameter defines the country to use for the Google search. It's a two-letter country code. (e.g., <code>us</code> for the United States, <code>uk</code> for United Kingdom, or <code>fr</code> for France). Head to the Google countries page for a full list of supported Google countries.
<code>hl</code>	Optional	Parameter defines the language to use for the Google search. It's a two-letter language code. (e.g., <code>en</code> for English, <code>es</code> for Spanish, or <code>fr</code> for French). Head to the Google languages page for a full list of supported Google languages.
<code>cr</code>	Optional	Parameter defines one or multiple countries to limit the search to. It uses <code>country{two-letter upper-case country code}</code> to specify countries and <code> </code> as a delimiter. (e.g., <code>countryFR countryDE</code> will only search French and German pages). Head to the Google cr countries page for a full list of supported countries.
<code>lr</code>	Optional	Parameter defines one or multiple languages to limit the search to. It uses <code>lang_{two-letter language code}</code> to specify languages and <code> </code> as a delimiter. (e.g., <code>lang_fr lang_de</code> will only search French and German pages). Head to the Google lr languages page for a full list of supported languages.

Advanced Filters

<code>tbs</code>	Optional	(to be searched) parameter defines advanced search parameters that aren't possible in the regular query field. (e.g., advanced search for patents, dates, news, videos, images, apps, or text contents).
<code>safe</code>	Optional	Parameter defines the level of filtering for adult content. It can be set to <code>active</code> or <code>off</code> , by default Google will blur explicit content.
<code>nfpr</code>	Optional	Parameter defines the exclusion of results from an auto-corrected query when the original query is spelled wrong. It can be set to <code>1</code> to exclude these results, or <code>0</code> to include them (default). Note that this parameter may not prevent Google from returning results for an auto-corrected query if no other results are available.
<code>filter</code>	Optional	Parameter defines if the filters for 'Similar Results' and 'Omitted Results' are on or off. It can be set to <code>1</code> (default) to enable these filters, or <code>0</code> to disable these filters.

Search Type

<code>tbm</code>	Optional	(to be matched) parameter defines the type of search you want to do. It can be set to: <code>(no tbm parameter)</code> : regular Google Search, <code>isch</code> : Google Images API, <code>lcl</code> - Google Local API, <code>vid</code> : Google Videos API, <code>nws</code> : Google News API, <code>shop</code> : Google Shopping API, <code>pts</code> : Google Patents API, or any other Google service.
------------------	----------	---

Pagination

<code>start</code>	Optional	Parameter defines the result offset. It skips the given number of results. It's used for pagination. (e.g., <code>0</code> (default) is the first page of results, <code>10</code> is the 2nd page of results, <code>20</code> is the 3rd page of results, etc.).

start	Optional	Parameter defines the result offset. It skips the given number of results. It's used for pagination. (e.g., 0 (default) is the first page of results, 10 is the 2nd page of results, 20 is the 3rd page of results, etc.).
		Google Local Results only accepts multiples of 20 (e.g. 20 for the second page results, 40 for the third page results, etc.) as the start value.
num	Optional	Parameter defines the maximum number of results to return. (e.g., 10 (default) returns 10 results, 40 returns 40 results, and 100 returns 100 results).
		i The use of num may introduce latency, and/or prevent the inclusion of specialized result types. It is better to omit this parameter unless it is strictly necessary to increase the number of results per page.
		i Results are not guaranteed to have the number of results specified in num .

Serpapi Parameters

engine	Optional	Set parameter to google (default) to use the Google API engine.
device	Optional	Parameter defines the device to use to get the results. It can be set to desktop (default) to use a regular browser, tablet to use a tablet browser (currently using iPads), or mobile to use a mobile browser.
no_cache	Optional	Parameter will force SerpApi to fetch the Google results even if a cached version is already present. A cache is served only if the query and all parameters are exactly the same. Cache expires after 1h. Cached searches are free, and are not counted towards your searches per month. It can be set to false (default) to allow results from the cache, or true to disallow results from the cache. no_cache and async parameters should not be used together.
async	Optional	Parameter defines the way you want to submit your search to SerpApi. It can be set to false (default) to open an HTTP connection and keep it open until you got your search results, or true to just submit your search to SerpApi and retrieve them later. In this case, you'll need to use our Searches Archive API to retrieve your results. async and no_cache parameters should not be used together. async should not be used on accounts with Ludicrous Speed enabled.
zero_trace	Optional	Enterprise only. Parameter enables ZeroTrace mode . It can be set to false (default) or true . Enable this mode to skip storing search parameters, search files, and search metadata on our servers. This may make debugging more difficult.
api_key	Required	Parameter defines the SerpApi private key to use.
output	Optional	Parameter defines the final output you want. It can be set to json (default) to get a structured JSON of the results, or html to get the raw html retrieved.
json_restrictor	Optional	Parameter defines the fields you want to restrict in the response. For example, setting it to organic_results[.]{title,snippet} will only return the title and snippet of the organic results. See JSON Restrictor for more details.

i Note on Search Queries using the parameter **num**

Due to Google's new **Knowledge Graph** layout, Google is ignoring the **num** parameter for the first page of results in many searches related to celebrities, famous groups, and popular media.

When **start** parameter is used and set to **1** or higher, the **num** parameter works as expected.

Until Google resolves this issue, if necessary, you may set **start** to **1** in order to get the parameter **num** to work normally.

However, the first **Organic Results** item and the **Knowledge Graph** will not be returned when using this approach.

to get the parameter `num` to work normally.

However, the first **Organic Results** item and the Knowledge Graph will not be returned when using this approach.

API Results

JSON Results

JSON output includes structured data for **organic results, local results, ad results, the knowledge graph, direct answer boxes, images results, news results, shopping results, video results, and more.**

A search status is accessible through `search_metadata.status`. It flows this way: **Processing** -> **Success** || **Error**. If a search has failed, `error` will contain an error message. `search_metadata.id` is the search ID inside SerpApi.

HTML Results

HTML output is useful to debug JSON results or support features not supported yet by SerpApi. HTML output gives you the raw HTML results from Google.

API Examples

Example with `q: Coffee` parameter

JSON Example

More complex examples with multiple optional parameters

The URL below fetches:

- The second page (`start=10` and `num=10`) of the results,
- for the search "Fresh Bagels" in Seattle,
- using Google.com in the United States,
- with the Google language UI set to English,
- with the adult content filter on,
- using the demo SerpApi key,
- and output the results in JSON.

JSON Example

```

Google Search API

Download OpenAPI Spec

```
GET /api/v1/search?engine=google
```

API Parameters

Search Query

q Required

Parameter defines the query you want to search. You can use anything that you would use in a regular Google search. e.g. `inurl:`, `site:`, `intitle:`, and more.

kgmid Optional

Defines a Knowledge Graph identifier (kgmid), representing entities in Google's Knowledge Graph. Format:

- Location Identifier (`/m/`): Typically followed by 2 to 7 characters. Used primarily to represent specific locations. Find the identifier by searching for the "Freebase ID" on Wikidata. Example: `kgmid=/m/02_286` refers to New York.
- Google Knowledge Graph Identifier (`/g/`): Typically followed by a longer alphanumeric string. Represents general entities in Google's Knowledge Graph. Find details on Wikidata. Example: `kgmid=/g/11f555cn8l` refers to TikTok.

Device

device Optional

The default parameter `desktop` defines the search on a desktop device. The `mobile` parameter defines the search on a mobile device. The `tablet` parameter defines the search on a tablet device.

Geographic Location

location Optional

Parameter defines from where you want the search to originate. If several locations match the location requested, we'll pick the most popular one. Head to the [Locations API](#) if you need more precise control.

uule Optional

Parameter is the Google encoded location you want to use for the search. SearchApi automatically generated the `uule` parameter when you use the `location` parameter but we allow you to overwrite it directly. `uule` and `location` parameters can't be used together.

Localization

google_domain Optional

The default parameter `google.com` defines the Google domain of the search. Check the full list of supported Google `google_domain` domains.

gl Optional

The default parameter `us` defines the country of the search. Check the full list of supported Google `gl` countries.

hl Optional

The default parameter `en` defines the interface language of the search. Check the full list of supported Google `hl` languages.

lr Optional

Localization

hl Optional

The default parameter **en** defines the interface language of the search. Check the full list of supported Google **hl** languages.

lr Optional

The **lr** parameter restricts search results to documents written in a particular language or a set of languages. The accepted format for this parameter is `lang_{2-letter country code}`. For instance, to filter documents written in Japanese, the value should be set to `lang_jp`. To incorporate multiple languages, a value like `lang_it|lang_de` restricts the search to documents written in either Italian or German. Google identifies the document language based on the top-level domain (TLD) of the document's URL, any language meta tags present, or the language utilized within the document's body text. Check the full list of supported Google **lr** languages.

cr Optional

The **cr** parameter restricts search results to documents originating in a particular country. Google determines the country of a document by the top-level domain (TLD) of the document's URL or by Web server's IP address geographic location. Check the full list of supported Google **cr** countries.

Filters

nfpr Optional

This parameter controls whether results from queries that have been auto-corrected for spelling errors are included. To exclude these auto-corrected results, set the value to **1**. By default, the value is **0**, meaning auto-corrected results are included.

filter Optional

This parameter controls whether the "Duplicate Content" and "Host Crowding" filters are enabled. Set the value to **1** to enable these filters, which is the default setting. To disable these filters, set the value to **0**.

safe Optional

This parameter toggles the SafeSearch feature for the results. SafeSearch operates by filtering out adult content from your search results. Google's filters use proprietary technology to check keywords, phrases and URLs. While no filters are 100 percent accurate, SafeSearch will remove the overwhelming majority of adult content from your search results. Set the value to `active` to enable SafeSearch. To disable it, set the value to `off`. By default, SafeSearch is disabled.

time_period Optional

This parameter restricts results to URLs based on date. Supported values are:

- `last_hour` - data from the past hour.
- `last_day` - data from the past 24 hours.
- `last_week` - data from the past week.
- `last_month` - data from the past month.
- `last_year` - data from the past year.
- Using `time_period_min` or `time_period_max` parameters, you can specify a custom time period.

Note, that the `time_period_min` and `time_period_max` parameters could be used separately as well.

time_period_min Optional

This parameter specifies the start of the time period. It could be used in combination with the `time_period_max` parameter. The value should be in the format `MM/DD/YYYY`.

time_period_max Optional

Filters

`MM/DD/YYYY`

`time_period_max` Optional

This parameter specifies the end of the time period. It could be used in combination with the `time_period_min` parameter. The value should be in the format `MM/DD/YYYY`.

Pagination

`num` Optional

This parameter specifies the number of results to display per page. Use in combination with the `page` parameter to implement pagination functionality.

`page` Optional

This parameter indicates which page of results to return. By default, it is set to `1`. Use in combination with the `num` parameter to implement pagination.

Optimization

`optimization_strategy` Optional

Controls how the search request is optimized. Available options:

- `performance` Default
- `ads` - optimizes for higher ad collection success rate, which may result in longer request processing times.

Engine

`engine` Required

Parameter defines an engine that will be used to retrieve real-time data. It must be set to `google`.

API key

`api_key` Required

The `api_key` authenticates your requests. Use it as a query parameter (`https://www.searchapi.io/api/v1/search?api_key=YOUR_API_KEY`) or in the Authorization header (`Bearer YOUR_API_KEY`).

Zero Data Retention

`zero_retention` Enterprise Only Optional

Set this parameter to `true` to disable all logging and persistent storage. No request parameters, HTML, or JSON responses are stored or logged. Suitable for high-compliance use cases. Debugging and support may be limited while enabled.

[Rewarded Review] First iPhone, Won't Go Back
I had been an Anti-iPhone Apple hater my whole life. Recently, I had switched everything I own from Android to Apple, own multiple Mac products and have made the decision that I will not be going back.

So why the switch? After the M1 Macs released, I became obsessed with how quick ... [More](#)

Answer Box - Organic Result

Why do we have seasons?

All Images Videos Forums Shopping News Web More Tools

The earth's spin axis is tilted with respect to its orbital plane. This is what causes the seasons. When the earth's axis points towards the sun, it is summer for that hemisphere. When the earth's axis points away, winter can be expected.

National Weather Service (.gov)

Mediterranean restaurant recommendations?? - Sacramento

Reddit · r/Sacramento · 50+ comments · 1 year ago

Kasbah Lounge is fantastic. The fattoush salad is one my favorite salads. More >	Kabob house on Fulton. Tiny little place that looks to be family owned, and the food is amazing. More >	Babylon City Market. Hands down, best shawarma in Sac More >
Top answer · 18 votes · a year...	17 votes · a year ago	17 votes · a year ago

What is your favorite Mediterranean food? I heard it makes you brainy.

Quora · 10+ answers · 2 years ago

Supported Locations API

Locations API allows you to search SerpApi supported locations. It should return an array of locations ordered by reach. Locations that reach the most people will be first. This API is free to use. Download the full **JSON** list of **supported locations**:

Download 

You can query <https://serpapi.com/locations.json> using a **GET** request with these parameters:

API Parameters

<code>q</code>	Optional	Parameter restricts your search to locations that contain the supplied string. (e.g., Austin will find 'Austin, TX', 'The University of Texas at Austin', 'Rochester, MN-Mason City, IA-Austin, MN,United States', etc.)
<code>limit</code>	Optional	Parameter limits the number of locations returned. (e.g., 5 will return only 5 locations. Maximum is 10.)

API Examples

Locations API example

The URL below fetches the 5 biggest locations that contains "Austin" in their name in our database. You can then use the location canonical name (e.g., **"Austin,Texas,United States"**) or the location id (e.g., **"585069efee19ad271e9c9b36"**) as the value of the param `location` for the `/search` API to get more precise results.

```
</> GET
```

```
1 | https://serpapi.com/locations.json?q=Austin&limit=5

EXHIBIT 19

Supported Google Locations API

GET /api/v1/locations

SearchApi supported locations API allows you to localize Google searches to particular geographic areas. This API is completely free.

API Parameters

Search Parameters

q Required

The search query to use to search for locations. For example, `new york` and `london`.

limit Optional

The maximum number of results to return. Defaults to `10`. Maximum is 100.

api_key Required

The `api_key` authenticates your requests. Use it as a query parameter (`https://www.searchapi.io/api/v1/locations?api_key=YOUR_API_KEY`) or in the Authorization header (`Bearer YOUR_API_KEY`).

Zero Data Retention

zero_retention Enterprise Only Optional

Set this parameter to `true` to disable all logging and persistent storage. No request parameters, HTML, or JSON responses are stored or logged. Suitable for high-compliance use cases. Debugging and support may be limited while enabled.

API Examples

Get supported locations

This API example retrieves the top 10 largest locations that include the term `london` in their name. You can then use `canonical_name` (e.g. `London,England,United Kingdom`) as the value of `location` parameter in the [Google Search API](#).

Response parameters:

- `google_id` - The unique identifier for the location as per Google's system.
- `google_parent_id` - The unique identifier for the parent location of the current location in Google's system. This points to existing `google_id`.
- `name` - the common name of the location.
- `canonical_name` - the official, standardized name of the location. **Use this value in in the [Google Search API](#).**
- `target_type` - specific classification of the location. This can be one of the following:
 - `Postal Code`
 - `City`
 - `Municipality`
 - `Canton`
 - `Neighborhood`
 - `County`
 - `City Region`
 - `Airport`
 - `University`
 - `District`
 - `Region`
 - `Province`
 - `Borough`
 - `Prefecture`
 - `Autonomous Community`
 - `Country`
 - `Union Territory`
 - `Governorate`
 - `Department`

- TV Region
 - Okrug
 - National Park
 - Territory
 - Congressional District
- `country_code` - the ISO 3166-1 alpha-2 two-letter country code. You can view the full list of [supported countries](#).
 - `reach` - the population size within the specified location.
 - `lat` (latitude) - the coordinate that represents the location's north-south position on the Earth's surface.
 - `lon` (longitude) - the coordinate that represents the location's east-west position on the Earth's surface.
